

1. Installation

1.1 Installation media

Since PrivateServer is an appliance, it can be delivered either as DVD-ROM or virtual machine file. In the latter case, appliance is pre-installed.

PrivateServer images are supported by VMWare ESXi Vsphere 5 and 5.5 versions.

1.2 Suggested Hardware

Please refer to [Operational Requirements](#) section 1.3 "Server".

1.3 Network features

Server

We suggest to keep the following concept:

- A minimum of 2 CPU core for each PrivateServer . We suggest these models:
 - Intel(R) Core(TM) i7 CPU 950 @ 3.07GHz
 - AMD Athlon(tm) 64 X2 Dual Core Processor 6000+

but the product is known to run smoothly on slower ones.

- A minimum of 4GB of RAM for each PrivateServer
- A minimum of 50GB of storage for each PrivateServer (consider raising up to 100GB in case of high number of users of a specific server)
- A minimum of one 100/1000 Mb/s NIC (or more NICs to setup the Network Segregation)
- Almost one public IP Address, NATted to the server's NIC or directly assigned to it
- One public hostname (with correct DNS resolution)
- One SSL Certificate (accordingly with the hostname)
