

# iPhone - Check the Configuration of the Application

To open the application settings

- 1. Go to the *More* tab
- 2. Select *Settings* item (fig. 1)
- 3. Tap the *Edit* button in the upper right corner

settings are now editable (fig. 2)

## Check Sip Server and Port

Check the correctness of the URL or IP address typed into the **SIP server** field of the settings page and ensure that it can be reached at the port indicated into **SIP sever port** field

## Check username and password

Make sure that the value of the **Username** field is the same of the one created on the server (by your system administrator or provider). There is no way to check the password, but to reinsert paying more attention

## Check obfuscation

The **Obfuscation** switch status and the **Obfuscation key** value must reflect the account configuration into the server; you have to obtain this information from your system administrator (or your provider). By default, the obfuscation is enabled and the standard key is 9
