

# Other functions and settings

## BlackBerry functions

### Changing the Access Point

To change the Access Point, select **Settings > Advanced Settings > Connection Settings** from the PrivateGSM menu. Restart the application for the change to take effect. PrivateGSM automatically reconnects after the change.

 WAP or MMS access points can not be used.

To change the access point:

 PrivateGSM WIFI edge

Advanced settings

SIP settings

Connection settings

Audio settings

Advanced SIP settings

Call state handling

Provisioning settings

1. Select Connection settings

 PrivateGSM WIFI edge

Connection settings

Preferred network interface:

Wi-Fi ▾

Mobile Transport:

Direct TCP ▾

APN name: ibox.tim.it

Username:

Password:

2. Insert the access point

### Ending and re-starting the connection to the server

You can end the connection to the server if you do not want to receive secure calls. The application remains in the background and the connection can be restarted at any time.

To end and re-start the server connection:

 PrivateGSM WIFI edge

Go offline

Hide

Exit

Switch Application

1. Select Go offline

 You cannot receive or make secure calls when the application is not connected to the server.

# Exit the application and end the connection to the server

To stop receiving secure calls, exit the application. This automatically ends the connection to the server.

To re-launch the application, open the mobile phone menu and select PrivateGSM. The connection is automatically re-started.

 You cannot receive or make secure calls when the application is not connected to the server.

To exit the application and automatically close the connection:

1. Select Exit

## iPhone functions

### Exit the application

If you want to close PrivateGSM disconnecting it, you have to kill the application:

|                                                                                     |                                                                                      |                                                                                       |
|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
|  |  |  |
| 1. Double click on HOME button                                                      | 2. Long tap on PrivateGSM icon until it starts to wiggle                             | 3. Tap on minus sign to close it                                                      |

! You cannot receive or make secure calls when the application is not running.

## Android functions
