

PrivateServer - 2.4.4027

Latest update

Unknown macro: 'page-info'

Release Notes

This small but important update features an **improved** list of the **SIP Session Logs**. From now on the Service Administrator can also read the **transport channel** on which a SIP sessions occurred and thus in glimpse he/she can understand if any **brute force attack** is happening or if any UDP SIP Session has been attempted.

Please take note that the update will erase your SIP SESSION LOGS.

Another useful feature is the **Provisioning Profile URI shown** in the **Web console**. Usually the Provisioning Profile URI is sent as a Text Message to the User's device in order to provide automatic configuration of PrivateGSM. Displaying the URI let the Service Administrator to copy it and send it via other channels (e.g. via email). This will be dramatically useful in case the user cannot receive Text Messages on the mobile device.

Minor improvements to the Web User Interface and some minor bug fixes are released as well.

PrivateServer - 2.4.4027

Improvements

- [PS-1207] - SIP transport is report in SIP session logs
- [PS-1216] - The provisioning profile's URI is now shown in the Web User Interface

Fixed Bugs

- [PS-591] - No caller's name is shown on the third callee's device if we're in a 3-way call
- [PS-1205] - Improved management of the Presence in case of malformed fields.
- [PS-1220] - Removed **raw_session_log** table from configuration backup
